

1. Ideation Phase

Introduction:

Auto Ticket Classification is a ServiceNow-based system that automatically categorizes incoming tickets based on their details, such as issue description, category, priority, or department.

Problem Identification:

Manually classifying a large number of tickets can take time and may lead to incorrect categorization. An automated method is needed to route tickets to the appropriate category or team.

Proposed Solution:

Use ServiceNow Flow Designer to create an automated flow. When a new ticket is created, the flow checks the relevant ticket information and automatically assigns the appropriate classification and routing details.

Main Idea:

The system can:

Detect a newly created ticket.

Read the ticket information.

Apply predefined classification conditions.

Assign the appropriate category.

Route the ticket to the required group or team.

Update the ticket automatically.

Expected Result:

The system reduces manual classification work, improves ticket routing, and provides a more consistent ticket-management process.
