

2. Requirement Analysis

1.Introduction:

Auto Ticket Classification is a system that automatically analyzes incoming support tickets and classifies them into the appropriate category, priority, and assignment group. It reduces manual work and helps resolve tickets faster.

2. Functional Requirements :

Automatically receive and read new tickets.

Identify the ticket category based on the description.

Determine the priority of the ticket.

Assign the ticket to the correct department/team.

Automatically update ticket fields.

Notify the assigned team.

Maintain ticket history for tracking.

Allow administrators to modify classification rules.

3. Non-Functional Requirements :

Accuracy: Classification should be reliable.

Performance: Tickets should be processed quickly.

Security: Only authorized users can access ticket information.

Scalability: The system should handle increasing ticket volumes.

Availability: The classification process should be available whenever tickets are created.

4. Inputs :

Ticket number

Short description

Detailed description

User information

Category and subcategory

Previous ticket information, if available

5. Processing

New Ticket → Read Ticket Details → Analyze Description → Identify Category & Priority → Select Assignment Group → Update Ticket → Notify Team

6. Expected Output :

The system should produce a properly classified ticket containing:

Category

Subcategory

Priority

Assignment group

Classification status
